

# Arts/Tech Collaboration

*With Embedded Systems and Kinetic Art*

**SIGGRAPH**2013

Erik Brunvand  
School of Computing  
University of Utah

## Agenda

***I argue that arts/technology collaboration is a powerful framework for enhancing ideas in both arenas***

I frame this in the context of *kinetic art* and its connection to *embedded systems*

## Cross-Disciplinary Class

- Bring Art students and Computer Science and Engineering (CSE) students together
  - Design and build embedded-system-controlled kinetic art
  - Goal is benefit for both groups of students
- Fundamental nature of *Design*?
  - Design thinking vs. computational thinking?

# Embedded Systems

- Computer systems that are embedded into a complete device
  - Often small or special purpose computers or microprocessors
  - Designed to perform one or a few dedicated functions
  - Often reactive to environmental sensors
  - Often designed to directly control output devices

5

SIGGRAPH2013

## Kinetic Art

- Contains moving parts
  - Depends on motion, sound, or light
- Often controlled by microcontrollers
  - motors, actuators, transducers...
- Often reactive to environment

6

SIGGRAPH2013

# Electronic Kinetic Art

7

SIGGRAPH2013

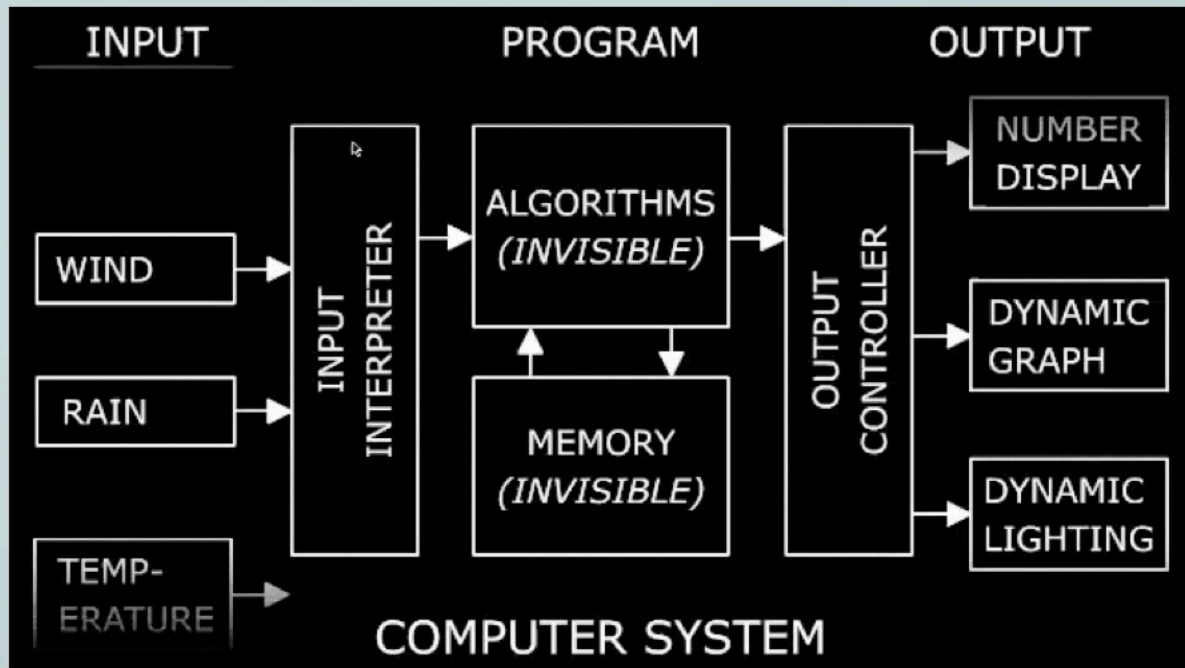

# SIGGRAPH Art Gallery

Drawing Machine, Robert Twomey, 2013

SIGGRAPH2013

# Jim Campbell's Algorithm

9

## Class Overview

- Basic reactive programming with embedded systems
  - Electronics fundamentals
  - Sensors and actuators as I/O
- Basic 3d art concepts
  - Formal elements: aesthetics, proportion, balance, tension
  - Material studies and mechanical linkages
- Studio-based instruction model

10

# Class Overview

- Individual and group projects
  - Everybody tries everything individually
  - Also work in interdisciplinary teams
- Finish with a gallery show
  - 2009/2010: Invisible Logic
  - 2010/2011: Intersectio
  - Spring 2012: Drawing Machines

# Enhancing Creativity

- Creative design and design-thinking: powerful concepts
  - One definition: enhanced creativity is generating many potential solutions instead of gravitating quickly to one

Kinetic art is serious stuff...

... but not regular CS projects

CS students have the freedom to explore without worrying about getting it "right"

# HW Infrastructure

- Controller – **Arduino**
- Sensors
  - Potentiometers/knobs, light, motion (PIR), distance, vibration ( piezo ), sound, temperature, etc.
- Actuators and transducers
  - LEDs , servos, DC motors, stepper motors, sound, etc.
- Other parts
  - LED drivers, transistors, resistors, diodes
  - LCD displays, SPI/I2C peripherals
  - Power supplies, soldering stations, wire, etc.

 SIGGRAPH 2013

## Student Comments

- I now have a much better understanding of how to "think about art" and also saw an entirely different side of computer science.
  - Artists have a completely different mindset and it was nice to get a new perspective on things. It really made me learn to appreciate the creative thinking they brought to the table.
- I enjoyed it and already have suggested it to several artists and engineers I know!
  - I feel more competent in both [art and computer science] having experienced each side in a new way.

18

 SIGGRAPH 2013

## Conclusions

- Embedded systems and kinetic art is a natural collaboration
  - Exploration of fundamental design concepts
  - Design-thinking is a natural complement to computational-thinking
- Studio instruction model is fascinating
  - Both groups of students benefit from working with each other
  - Cross-college collaboration – just the beginning!
