Catdance Film Festival—The Sequel Saturday March 23

This year's Catdance Film Festival was every bit as good as last year's—in attendance, comraderie, potluck food, graciousness of hosts, and films

To kick off the screenings we once again watched *C'était un Rendezvous*, the famous 9 minute short documenting a high speed tour through Paris as viewed from the front bumper of a Ferrari.

We then took in the first half hour or so of Ken Borg's History Channel special on the [history of the E-type](#).

The feature film of the evening was Clint Eastwood's "[Play Misty for Me](#)" (1971) which has ample footage of himself driving an XK150 drop head coupe up Pacific Hwy 1 near Carmel, CA. The actual plot is down-right creepy, with an obsessed

girl friend turning murderous in pursuit of the protagonist.

Even more frightful was the fact that Eastwood's XK150 sported a Leaper bonnet mascot—see [p. 7](#)—have these Hollywood folks no respect?!? In any case, no one left early—perhaps they were too spooked to drive

down the hill unaccompanied.

A few photos are shown here — the full set is available on the [2013 Memories section](#) of our club web site. Thanks go to Dan Schweikert for supplying some of the better ones.

Attending were: Dave and Debi Hoskins, Mike and Susan Cady, Duane and LeAnn Allred, J and Kay Jennings, Jim and Hermione Klekas, Marvin and Connie May, Ken and Joann Borg, John and Liz Green, Dan Schweikert, hosts Allison, Barry and Marcel Hanover, and your obedient scribe, Gary Lindstrom.

Spring Fun Rallye Saturday April 27

Calling all adventuresome WMJR members (and friends) who would like to dust off their Britmobile and have a little Spring fun.

We will meet at the [Walmart parking lot](#) at the mouth of Parley's Canyon at 10:00 am on Saturday April 27th. Many folks will remember this as a Kmart lot in prior days.

We will have directions for the rallye and where to eat

lunch after.

The rallye will be about 1 - 1/2 hrs. No attorney will be necessary the directions are very clear where each stop is. Bring a pencil to fill in the blanks on your sheet. Any questions.

Call John/Liz Green 801-451-5776 home, or 801-831-1668 cell.

Pray for a good sunny day!

Be transported in style to your final resting place ...

Tech Info: SU Carburetors

From *The Cat Fancier*, Official Journal of the Jaguar Owner's Club of Oregon, March 2013
By Eric Wilhelm / Moss Motors Staff

SU carburetors are some of the simplest 'full function' carburetors ever put on relatively modern cars. However, since they work so differently from most other carburetors, few people in the USA really understand them well.

Many, if not most, problems attributed to these carbs' being 'out of tune' are really faults of the ignition system, valve train, or something else. Before blaming or 'fixing' the carburetor, it is essential that all other engine and engine-related systems are in fine order and working well, and that the operation of the SU is understood.

SU carburetors operate on a system variously known as 'variable venturi,' 'variable choke,' 'constant pressure,' or 'constant depression.' What this means

produced by the air piston (also known as the air valve) moving up and down in response to the engine vacuum. Since the tapered fuel metering needle is mounted

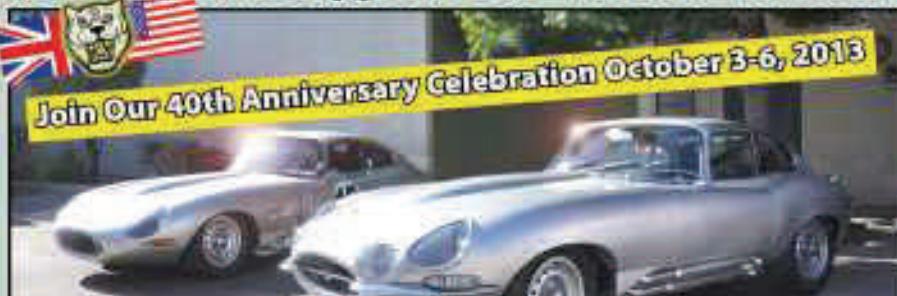

is that the effective area of the carburetor venturi is variable, producing constant air velocity and constant pressure differential across the jet orifice. This is

in this piston, and acts within the fuel jet, the SU has a variable jet which responds directly to engine vacuum. Since engine vacuum is a function of the operating condition and air/fuel requirements of an engine, the SU carb is ideally suited to meeting the re-

uirements of an engine by means of this direct feed-back loop, rather than by the complicated and empirical means employed by almost all other carburetors.

Even for the theoretically "abnormal" conditions of cold starting and acceleration under load, SUs employ a simple means of satisfying an engine's requirements. Cold start is obtained by increasing the fuel flow, without also blocking the incoming air. This is done by either lowering the height of the jet, thereby increasing its effective area (H and HS types); by passing additional fuel into the carb venturi from a separate device on the carb (HIF type); or by starting the engine largely on a very rich mixture from a separate small auxiliary starting carburetor ("thermo-carb", used with HD types.) Extra mixture richness for acceleration is provided by a classically elegant means: the upward motion of the air piston is retarded by the oil damper within the piston guide rod. This condition causes greater fuel flow out of the

jet in relation to the air flow.

This is why the oil in the dashpot is essential. Return of the piston is, in most SUs, aided by a spring, the tension of which is critical to proper functioning of this system. 'If it ain't broke, don't fix it' definitely applies to carburetors. Be sure that the problem lies with the carburetors before attempting to fix them! Before trying to tune your carbs, it is advisable to do the following:

♦♦ Check engine's ignition system for correct adjustment and function.

♦♦ Check valve clearances, compression, and ensure a lack of vacuum leaks in the intake system. Any problems with these will prevent proper tuning of the carburetors.

Make sure that the carbs are clean enough to function correctly, and that their mechanical components are work-

ing correctly. Check and/or clean the following:

1. Float bowl - clean any sediment and varnish.
2. Float - check for leaks and adjustment.
3. Float valve - not binding, and able to reliably shut off fuel flow.
4. Air chamber and piston - cleanliness and freedom of motion absolutely imperative. Ensure the piston springs have not been stretched or otherwise damaged.
5. Metering needles - straight and unworn jets; properly centered on metering needles and unworn Throttle shafts; unbent and unworn connections; tight and leak-free.
6. Air and fuel filters - clean, present, and of sufficient flow capacity for your engine.

While specific instructions for adjusting and balancing SU carbs for a particular car are usually found in the appropriate workshop manual, they are not always

too clear. The most basic idea to keep in mind is that the air flow and mixture are the same from one carb to the other. A basic 'generic' procedure follows:

1. Warm up engine to normal operating temperature.
2. Remove air cleaners, and disconnect choke cable from carb linkage. Loosen clamping bolts on the connecting rod between the throttle shafts, so the throttle shafts can be operated independently. Back off the fast idle screw(s) well away from fast idle cam(s).
3. While maintaining a steady slow idle, use a Unisyn (or the old 'tube in the ear' method) to set the carbs to the same air flow by adjusting the slow idle screws.
4. With the air flow balanced, check the air/fuel mixture of each carb by either pushing up on the piston lifting pin on the side of each carb, or by lifting the piston. If engine speed
5. After the mixture adjustment, the idle speed may be no longer satisfactory. If not, re-adjust the slow idle screws to the desired idle speed, while maintaining a bal-

increases, the mixture is too rich, and the mixture adjustment nut should be screwed up one flat (1/6 of a full turn.) If the engine speed decreases, unscrew the nut one flat. (This instruction applies to H and HS types - HIF and HD type carbs have mixture adjustment screws, which operate in similar fashion.) Between adjustments, 'rev' the engine to clear it, and allow it to return to idle before proceeding. Continue this procedure, alternating from one carb to the other, until, when the pistons are lifted, the engine speed either doesn't change, or rises slightly and then falls to an even speed. The mixture settings are then satisfactory.

anced air flow (see step 3 above.)

6. Re-install air filters and re-check the mixture settings, using the piston lifting pins. (Some air filters are restrictive enough to otherwise cause a slightly overly-rich mixture.)
7. Re-tighten the throttle shaft connectors, reconnect the choke cable, and set the fast idle screws according to the appropriate workshop manual. Do not neglect this last step, as it is vital for correct starting of your engine when using the choke.

Problems That Aren't

The cork washers for H type jet glands and sealing ring do not come pre-formed. They are, and always have been, supplied as cylindrical pieces which form their beveled shapes after installation.

THE ULTIMATE JAGUAR PARTS SPECIALIST

More to Us than meets the eye

SNG Barratt Group's blend of skilled craftsmen and 150 years combined sales experience means that we are the World's leading independent supplier of Jaguar parts for all cars from 1949 through to current models. Not only that, we also manufacture thousands of products on-site and have access to tens of thousands more. Our aim is to keep your Jaguar on the road.

Jaguar elegance: The beauty that's more than skin-deep

Inspect each sweep, each curve, each fluid line of any Jaguar, and you bear witness to Jaguar elegance—a grace of styling that has been engineered from within the heart of the automobile itself. Jaguar elegance is reflected here in two exciting motor cars. One, the new Jaguar XK-E, is available either as an open sports roadster with interchangeable soft or hard top or a completely enclosed *Gran Turismo* coupe. For the family man who requires a roomier vehicle, there is the versatile Jaguar 3.8 Sedan. Pure Jaguar from the word go, this car has been titled "the sedan that behaves like a sports car." Discover Jaguar elegance yourself. See and drive either of these fine Jaguars soon at your local dealer's. JAGUAR CARS INC., 32 East 57th Street, New York 22, N. Y.

SU Carburetors —*cont'd from p. 5*

Needle dimensions are from the upper shoulder down, in 1/8" increments. If one needle is a bit longer than another of the same type, it doesn't matter. The number or letter stamping on the shank of metering needles may be raised enough as to prevent entry of the needle into the bottom of the air piston. This is a very common occurrence. Simply smooth off the burrs until the needle fits.

Some of the holes in H-type jet levers seem to be grossly oversized. They were designed this way to provide for some lost motion in their operation, and to ensure a full return to the "choke off" position.
