Lecture 12: Hardware for Arithmetic

- Today's topics:
 - Logic for common operations
 - Designing an ALU

Logic Blocks

- A logic block has a number of binary inputs and produces a number of binary outputs – the simplest logic block is composed of a few transistors
- A logic block is termed combinational if the output is only a function of the inputs
- A logic block is termed sequential if the block has some internal memory (state) that also influences the output
- A basic logic block is termed a gate (AND, OR, NOT, etc.)
 - We will only deal with combinational circuits today

Truth Table

- A truth table defines the outputs of a logic block for each set of inputs
- Consider a block with 3 inputs A, B, C and an output E that is true only if exactly 2 inputs are true

_	Α	В	С	Е

Truth Table

- A truth table defines the outputs of a logic block for each set of inputs
- Consider a block with 3 inputs A, B, C and an output E that is true only if exactly 2 inputs are true

Α	В	C	Е	
0	0	0	0	
0	0	1	0	
0	1	0	0	
0	1	1	1	
1	0	0	0	Can be compressed by only
1	0	1	1	representing cases that
1	1	0	1	have an output of 1
1	1	1	0	,

Boolean Algebra

- Equations involving two values and three primary operators:
 - OR: symbol + , X = A + B → X is true if at least one of A or B is true
 - AND : symbol . , X = A . B → X is true if both A and B are true
 - NOT : symbol , $X = A \rightarrow X$ is the inverted value of A

Boolean Algebra Rules

- Identity law : A + 0 = A ; A . 1 = A
- Zero and One laws: A + 1 = 1; A.0 = 0
- Inverse laws : A . A = 0 ; A + A = 1
- Commutative laws: A + B = B + A ; A . B = B . A
- Associative laws: A + (B + C) = (A + B) + C
 A . (B . C) = (A . B) . C
- Distributive laws : A . (B + C) = (A . B) + (A . C)
 A + (B . C) = (A + B) . (A + C)

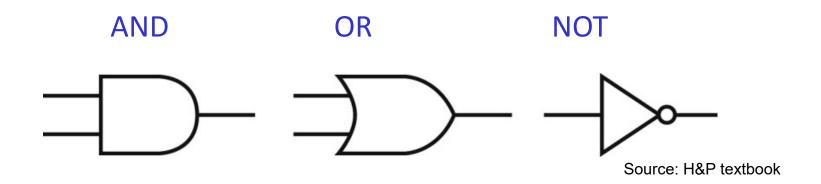

DeMorgan's Laws

$$\bullet \overline{A + B} = \overline{A} \cdot \overline{B}$$

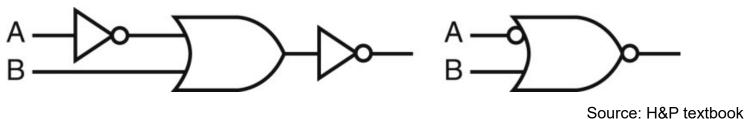

$$\bullet \ A . B = A + B$$

Confirm that these are indeed true

Pictorial Representations

What logic function is this?

ource. Har textbook

Boolean Equation

 Consider the logic block that has an output E that is true only if exactly two of the three inputs A, B, C are true

Multiple correct equations:

Two must be true, but all three cannot be true:

$$E = ((A . B) + (B . C) + (A . C)) . (A . B . C)$$

Identify the three cases where it is true:

$$E = (A . B . \overline{C}) + (A . C . \overline{B}) + (C . B . \overline{A})$$

Sum of Products

- Can represent any logic block with the AND, OR, NOT operators
 - Draw the truth table
 - For each true output, represent the corresponding inputs as a product
 - The final equation is a sum of these products

Α	В	C	Е
0	0	0	0
0	0	1	0
0	1	0	0
0	1	1	1
1	0	0	0
1	0	1	1
1	1	0	1
1	1	1	0

$$(A . B . \overline{C}) + (A . C . \overline{B}) + (C . B . \overline{A})$$

- Can also use "product of sums"
- Any equation can be implemented with an array of ANDs, followed by an array of ORs

NAND and NOR

- NAND: NOT of AND: A nand B = A.B
- NOR: NOT of OR: A nor B = A + B
- NAND and NOR are *universal gates*, i.e., they can be used to construct any complex logical function

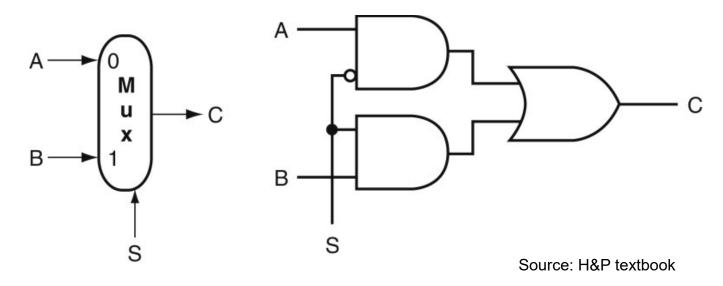

Common Logic Blocks – Decoder

Takes in N inputs and activates one of 2^N outputs

I ₀	I ₁	I ₂		O ₀	01	02	O ₃	O ₄	O ₅	O ₆	O ₇
0	0	0		1	0	0	0	0	0	0	0
0	0	1		0	1	0	0	0	0	0	0
0	1	0		0	0	1	0	0	0	0	0
0	1	1		0	0	0	1	0	0	0	0
1	0	0		0	0	0	0	1	0	0	0
1	0	1		0	0	0	0	0	1	0	0
1	1	0		0	0	0	0	0	0	1	0
1	1	1		0	0	0	0	0	0	0	1
	3-to-8 Decoder O ₀₋₇										

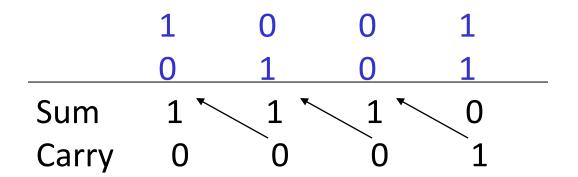

Common Logic Blocks – Multiplexor

 Multiplexor or selector: one of N inputs is reflected on the output depending on the value of the log₂N selector bits

2-input mux

Adder Algorithm

Truth Table for the above operations:

A	В	Cin	Sum Cout
0	0	0	
0	0	1	
0	1	0	
0	1	1	
1	0	0	
1	0	1	
1	1	0	
1	1	1	

Adder Algorithm

	1	0	0	1	
	0	1	0	1	
Sum	1	1	1	0	
Carry	0	0	Ô	1	

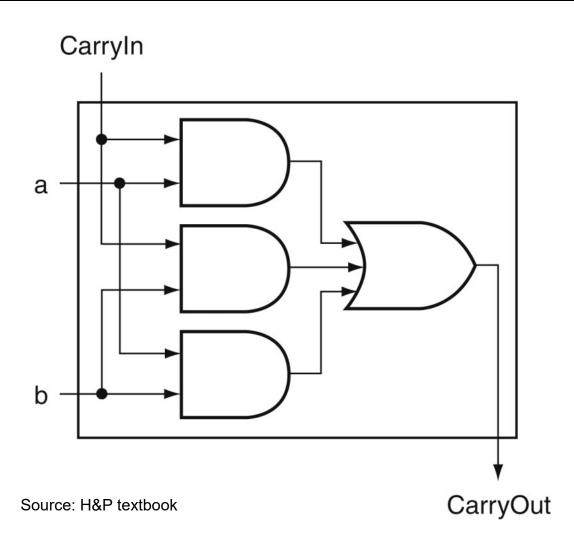

Truth Table for the above operations:

В	Cin	Sum Cout
0	0	0 0
0	1	1 0
1	0	1 0
1	1	0 1
0	0	1 0
0	1	0 1
1	0	0 1
1	1	1 1
	B 0 0 1 1 0 0 1 1	B Cin 0 0 0 1 1 0 1 1 0 0 0 1 1 1 0 1 1 1 1

Equations:

Sum = Cin
$$.\overline{A} .\overline{B} + B .\overline{Cin} .\overline{A} + A .\overline{Cin} .\overline{B} + A .B .Cin$$

Carry Out Logic

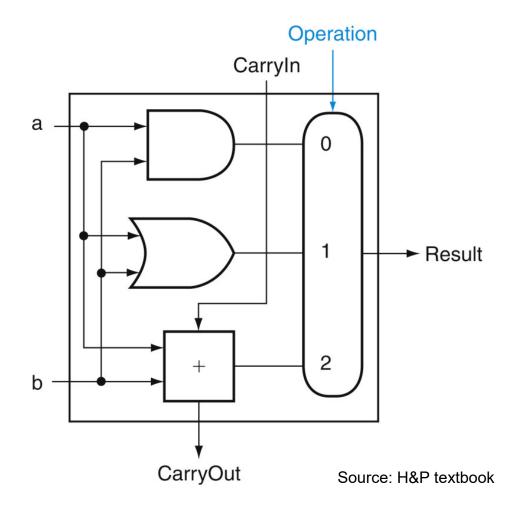

Equations:

Sum = Cin
$$.\overline{A} .\overline{B} + B .Cin .\overline{A} + A .Cin .\overline{B} + A .B .Cin$$

1-Bit ALU with Add, Or, And

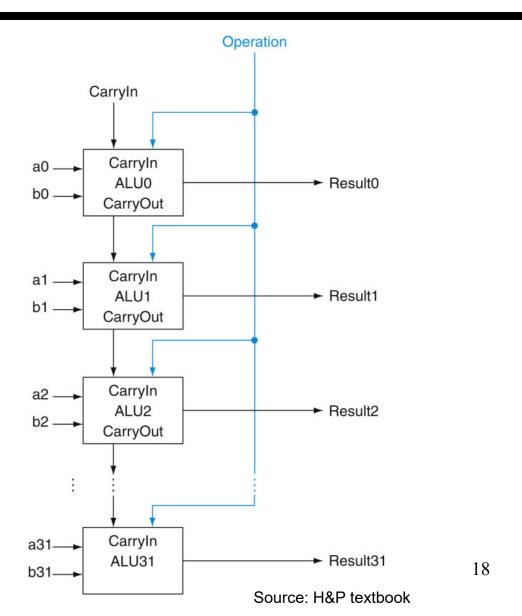

Multiplexor selects between Add, Or, And operations

17

32-bit Ripple Carry Adder

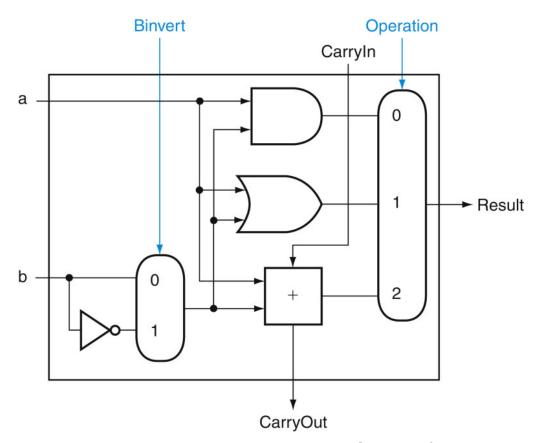

1-bit ALUs are connected "in series" with the carry-out of 1 box going into the carry-in of the next box

Incorporating Subtraction

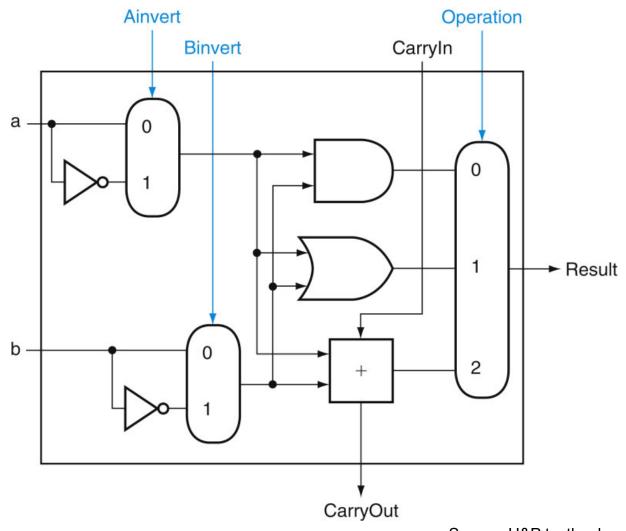

Must invert bits of B and add a 1

- Include an inverter
- CarryIn for the first bit is 1
- The CarryIn signal (for the first bit) can be the same as the Binvert signal

Source: H&P textbook

Incorporating NOR and NAND

Source: H&P textbook

Control Lines

What are the values of the control lines and what operations do they correspond to?

	Ai	Bn	Op
AND	0	0	00
OR	0	0	01
Add	0	0	10
Sub	0	1	10
NAND	1	1	01
NOR	1	1	00
